Quality Assurance Findings Report

Project Information

Project Name: AI/ML Web Application

Testing Cycle: Day 6 QA Activities

Prepared By: QA Tester Intern

Date: 18 June 2026

QA Findings

1. Functional Testing Findings

Positive Findings

- User authentication workflows operated correctly.
- Registration process completed successfully.
- Dashboard navigation functioned as expected.
- Report generation and download features worked properly.
- AI/ML prediction functionality produced expected outputs.

Issues Identified

Finding ID	Description	Severity
QA-F001	Unsupported file formats were accepted during upload	High
QA-F002	Dashboard accessible without authentication	Critical

Resolution Status

Both issues were fixed and verified during regression testing.

---

2. API Validation Findings

Tested Areas

- GET Requests
- POST Requests
- PUT Requests
- DELETE Requests

Findings

- APIs returned correct status codes.
- Request and response structures matched specifications.
- Error handling was consistent.
- API authentication controls worked correctly.

Result

API Validation Status: PASSED

---

3. Regression Testing Findings

Objective

To ensure application stability after defect fixes.

Findings

- Previously reported defects no longer reproduced.
- Existing functionality remained unaffected by fixes.
- No new defects were introduced.

Result

Regression Testing Status: PASSED

---

4. Performance Testing Findings

Observations

Metric	Result
Average Response Time	2.05 Seconds
Peak Load Tested	200 Concurrent Users
Maximum Throughput	240 Requests/Second
Error Rate	1.6%

Findings

- Application remained stable under expected load.
- Dashboard performance met response time requirements.
- AI prediction services performed within acceptable limits.
- Minor API delays observed during peak load conditions.

Recommendation

Implement API caching and optimize backend processing for future scalability.

---

5. Security Testing Findings

Security Areas Evaluated

- Authentication
- Authorization
- Session Management
- SQL Injection Protection
- XSS Protection
- File Upload Security
- API Access Control

Findings

- Unauthorized access attempts were blocked.
- Session timeout mechanisms functioned correctly.
- Input validation prevented common injection attacks.
- File upload validation worked after defect resolution.

Result

Security Validation Status: PASSED

Defect Analysis

Severity	Count
Critical	1
High	1
Medium	2
Low	1

Total Defects Identified

5

Total Defects Closed

5

Defect Closure Rate

100%

Quality Metrics

Metric	Value
Functional Pass Rate	96%
Regression Pass Rate	100%
Security Pass Rate	100%
API Validation Pass Rate	100%
Defect Closure Rate	100%
Critical Defects Open	0

Strengths Identified

- Stable authentication and authorization system.
- Reliable API functionality.
- Good overall application performance.
- Effective security controls.
- Successful defect resolution process.
- High regression stability.

Improvement Opportunities

1. Optimize API response times during peak traffic.
2. Enhance monitoring for large file uploads.
3. Increase automation test coverage.
4. Conduct higher-volume stress testing.
5. Implement additional security penetration testing.

Final Assessment

The application successfully passed all major quality assurance activities including functional, regression, performance, API, and security testing.

No critical or high-priority defects remain open.

The software demonstrates acceptable quality, stability, performance, and security characteristics.
